I used an Adafruit laser diode, and old USB cord, a USB charger, a light socket adapter, and this 3D printed bracket to make my own laser parking aid.

The light on the garage door opener comes on when the garage door is opened or closed.
The light bulb adapter screws into one of the two light bulb sockets on the garage door opener.
The USB charger plugs into the light bulb adapter.

Clip one end off the old USB cord and solder the cable to the laser diode, to give the laser diode a USB connector.
Plug the USB connector from the laser diode into the USB charger.
The laser diode slides nicely into the 3D printed bracket.
The bracket is mounted in a convenient location.
The bracket is adjusted to put a laser dot on your car's dashboard as a reference point.
A couple of drops of crazy glue to keep the bracket pivots from moving long term.
...and Bob's your uncle!
